The nightly backup writes a compressed dump of the memory bank to the backups volume, and a restore replays it into an empty database. The nightly backup writes a compressed dump of the memory bank to the backups volume, and a restore replays it into an empty database. The nightly backup writes a compressed dump of the memory bank to the backups volume, and a restore replays it into an empty database. The nightly backup writes a compressed dump of the memory bank to the backups volume, and a restore replays it into an empty database. The nightly backup writes a compressed dump of the memory bank to the backups volume, and a restore replays it into an empty database. The nightly backup writes a compressed dump of the memory bank to the backups volume, and a restore replays it into an empty database.

The nightly backup writes a compressed dump of the memory bank to the backups volume, and a restore replays it into an empty database. The nightly backup writes a compressed dump of the memory bank to the backups volume, and a restore replays it into an empty database. The nightly backup writes a compressed dump of the memory bank to the backups volume, and a restore replays it into an empty database. The nightly backup writes a compressed dump of the memory bank to the backups volume, and a restore replays it into an empty database. The nightly backup writes a compressed dump of the memory bank to the backups volume, and a restore replays it into an empty database. The nightly backup writes a compressed dump of the memory bank to the backups volume, and a restore replays it into an empty database.

The nightly backup writes a compressed dump of the memory bank to the backups volume, and a restore replays it into an empty database. The nightly backup writes a compressed dump of the memory bank to the backups volume, and a restore replays it into an empty database. The nightly backup writes a compressed dump of the memory bank to the backups volume, and a restore replays it into an empty database. The nightly backup writes a compressed dump of the memory bank to the backups volume, and a restore replays it into an empty database. The nightly backup writes a compressed dump of the memory bank to the backups volume, and a restore replays it into an empty database. The nightly backup writes a compressed dump of the memory bank to the backups volume, and a restore replays it into an empty database.

The nightly backup writes a compressed dump of the memory bank to the backups volume, and a restore replays it into an empty database. The nightly backup writes a compressed dump of the memory bank to the backups volume, and a restore replays it into an empty database. The nightly backup writes a compressed dump of the memory bank to the backups volume, and a restore replays it into an empty database. The nightly backup writes a compressed dump of the memory bank to the backups volume, and a restore replays it into an empty database. The nightly backup writes a compressed dump of the memory bank to the backups volume, and a restore replays it into an empty database. The nightly backup writes a compressed dump of the memory bank to the backups volume, and a restore replays it into an empty database.

The nightly backup writes a compressed dump of the memory bank to the backups volume, and a restore replays it into an empty database. The nightly backup writes a compressed dump of the memory bank to the backups volume, and a restore replays it into an empty database. The nightly backup writes a compressed dump of the memory bank to the backups volume, and a restore replays it into an empty database. The nightly backup writes a compressed dump of the memory bank to the backups volume, and a restore replays it into an empty database. The nightly backup writes a compressed dump of the memory bank to the backups volume, and a restore replays it into an empty database. The nightly backup writes a compressed dump of the memory bank to the backups volume, and a restore replays it into an empty database.
